

PROJECT DESIGN PHASE-II

Data Flow Diagram & User Stories

Data Flow Diagrams

The proposed system receives structured employee information from an Excel spreadsheet and moves it through ServiceNow's import process. The Import Set acts as the staging area, the Transform Map controls the field mapping and transformation, and the Employee Test table stores the resulting employee records. Coalesce is used on the selected employee identifier to distinguish existing records from new records. Reports and the dashboard provide a view of the resulting data.

DFD – Level 0 (Context View)

Flow: The administrator prepares and uploads the spreadsheet → ServiceNow loads the file into the Employee Import staging table → the Transform Map maps source fields to the Employee Test table → Coalesce determines whether records are inserted or updated → the resulting employee data is reviewed through reports and the Employee Analytics Dashboard.

DFD – Level 1 (Process View)

User Stories

The user stories below follow the structure in the supplied template. They describe the work an HR or ServiceNow administrator needs to perform to complete the employee-data import and monitoring process.

Note: No external customer-facing mobile application, social login or third-party API is part of the implemented project scope.

Date	03 October 2026
Team ID	SWTID-2026-8740
Project Name	Import Data using Transform Maps (Spreadsheet)
Maximum Marks	4 Marks

HR / ServiceNow Administrator	Excel Employee Spreadsheet	ServiceNow Import Process	Employee Test Table	Reports / Dashboard
Uploads file →	Employee data →	Transform & Coalesce →	Employee records →	View / analyse

Process	Input	Processing / Data Store	Output
1. Prepare Data	Excel spreadsheet	Employee ID, Name, Email, Department, Location	Structured source file
2. Load Data	Excel spreadsheet	Import Set table: u_employee_import	Staged import records
3. Transform Data	Staged import records	Transform Map: Sample Spreadsheet Import; source-to-target field mapping	Mapped employee records
4. Identify Existing Records	Mapped employee data	Coalesce using employee identifier	Insert or update decision
5. Store Employee Data	Transformed records	Target table: u_employee_test	Employee records
6. Report & Monitor	Employee records	Department/location/list reports and dashboard	Management view

User Type	Functional Requirement (Epic)	User Story Number	User Story / Task	Acceptance Criteria	Priority	Release
ServiceNow Administrator	Employee Data Import	USN-1	As an administrator, I can upload an Excel spreadsheet containing employee information into the ServiceNow import process.	The file is accepted and the employee rows are loaded into the Employee Import staging table.	High	Release-1

User Type	Functional Requirement (Epic)	User Story Number	User Story / Task	Acceptance Criteria	Priority	Release
ServiceNow Administrator	Employee Data Import	USN-2	As an administrator, I can use an existing Employee Import table when loading another spreadsheet.	The new spreadsheet rows are loaded into the selected import table without changing the target table structure.	High	Release-1
ServiceNow Administrator	Data Transformation	USN-3	As an administrator, I can map Employee ID, Employee Name, Email, Department and Location from the source to the Employee Test table.	All required source fields have corresponding target mappings and the transform completes successfully.	High	Release-1
ServiceNow Administrator	Data Transformation	USN-4	As an administrator, I can execute the Transform Map after loading the spreadsheet.	The transformation completes and the target Employee Test table contains the processed records.	High	Release-1
ServiceNow Administrator	Duplicate Prevention	USN-5	As an administrator, I can use Coalesce to identify an existing employee during repeated imports.	A matching employee is updated instead of a second employee record being inserted.	High	Release-1
ServiceNow Administrator	Import Verification	USN-6	As an administrator, I can review transform history after an import.	The history shows the import result, including inserted, updated or ignored rows.	High	Release-1
HR / ServiceNow Administrator	Reporting	USN-7	As an administrator, I can view employee records grouped by department.	A department report displays the count of employee records for each department.	Medium	Release-1
HR / ServiceNow Administrator	Reporting	USN-8	As an administrator, I can view employee records grouped by location.	A location report displays employee distribution by location.	Medium	Release-1
HR / ServiceNow Administrator	Dashboard	USN-9	As an administrator, I can view employee reports from one dashboard.	The Employee Analytics Dashboard contains the configured department, location and employee list reports.	Medium	Release-1
Administrator	Access Control	USN-10	As an administrator, I can control access to dashboard information using available ServiceNow access settings.	Only authorized users/groups/roles are given access where configured.	Medium	Release-1
