

PROJECT DESIGN PHASE-II

Solution Requirements (Functional & Non-functional)

Functional Requirements

The functional requirements below are derived from the completed employee-data import workflow. They cover the capabilities required to load, transform, maintain, verify and report employee information in ServiceNow.

Non-functional Requirements

Requirement Traceability to Implemented Project

The requirements are traceable to the implemented features: the Employee Import staging table, Sample Spreadsheet Import Transform Map, Employee Test target table, Coalesce configuration, transform history, three reports and Employee Analytics Dashboard.

Date	03 October 2026
Team ID	SWTID-2026-8740
Project Name	Import Data using Transform Maps (Spreadsheet)
Maximum Marks	4 Marks

FR No.	Functional Requirement (Epic)	Sub Requirement (Story / Sub-Task)
FR-1	Employee Data Preparation	Prepare a structured spreadsheet containing Employee ID, Employee Name, Email, Department and Location.
FR-2	Employee Data Import	Load an Excel file through ServiceNow Load Data into the Employee Import staging table (u_employee_import).
FR-3	Data Transformation	Create and execute the Sample Spreadsheet Import Transform Map from Employee Import to Employee Test (u_employee_test).
FR-4	Field Mapping	Map Employee ID, Employee Name, Email, Department and Location from source fields to the corresponding target fields.
FR-5	Duplicate Prevention and Update	Enable Coalesce on the selected employee identifier so matching employee records are updated instead of duplicated.
FR-6	Import Verification	Review transform status/history and identify inserted, updated and ignored rows after an import.
FR-7	Employee Reporting	Generate department, location and employee-list reports from the Employee Test table.
FR-8	Employee Analytics Dashboard	Add the configured reports to the Employee Analytics Dashboard for centralized monitoring.

NFR No.	Non-Functional Requirement	Description
NFR-1	Usability	The import, transformation and reporting workflow should be understandable to a ServiceNow administrator and should use standard ServiceNow navigation and forms.
NFR-2	Security	Access to ServiceNow records, reports and dashboard configuration should follow the platform's roles and access controls. The project also uses the documented ACL setting required for dashboard creation.
NFR-3	Reliability	The process should provide a consistent result for repeated imports: new employee IDs can be inserted, matching IDs can be updated through Coalesce, and unchanged repeated data can be ignored.

NFR No.	Non-Functional Requirement	Description
NFR-4	Performance	The solution should use ServiceNow's standard import and transformation mechanisms to process spreadsheet records without unnecessary manual record-by-record entry. No specific throughput benchmark is defined in the project document.
NFR-5	Availability	The solution is intended to be accessed through the ServiceNow platform, with employee data and reports available through the configured application when the ServiceNow instance is available.
NFR-6	Scalability	The staging-table and Transform Map approach supports repeated spreadsheet imports and larger sets of employee rows without redesigning the basic field-mapping workflow. Further large-scale automation can be added later.
