

Project Design Phase

Proposed Solution Template

Proposed Solution Template:

Project team shall fill the following information in the proposed solution template.

Date	03 October 2026
Team ID	SWTID-2026-8740
Project Name	Employee Data Management using ServiceNow Import Sets and Transform Maps
Maximum Marks	2 Marks

S.No.	Parameter	Description
1	Problem Statement (Problem to be solved)	Employee data received through spreadsheets needs to be brought into ServiceNow accurately and consistently. Manual entry and repeated imports can lead to unnecessary duplicate records, inconsistent updates and additional verification work. The project addresses this by creating a structured import process for employee information.
2	Idea / Solution description	The proposed solution uses ServiceNow Import Sets to receive Excel employee data, a Transform Map to map source fields to the Employee Test target table, and Coalesce on Employee ID to identify existing employees. New employees are inserted, existing employees are updated, and unchanged records do not need a new duplicate entry. Reports for department and location, along with an Employee Analytics Dashboard, provide a simple way to review the resulting data.
3	Novelty / Uniqueness	The solution combines standard ServiceNow capabilities into one repeatable employee-data workflow. Its key implementation point is the use of Employee ID as the matching value through Coalesce, so the same employee can be recognized during later imports. The project also connects the import process to practical reporting instead of stopping at data loading.
4	Social Impact / Customer Satisfaction	The solution reduces repetitive manual data entry and makes employee information easier to review. For administrators, the workflow provides a consistent way to load and update records and a dashboard for viewing employee information. This can improve confidence in routine data maintenance, although the project is scoped as an academic implementation rather than a measured production deployment.
5	Business Model (Revenue Model)	The project is an internal data-management solution rather than a commercial product. Therefore, no direct revenue model is required for the implemented version. In an organizational setting, its value would come from reducing administrative effort and improving data-maintenance efficiency. If offered as a service, implementation, configuration and support could form a service-based commercial model.

S.No.	Parameter	Description
6	Scalability of the Solution	The workflow can be extended by adding more employee fields, additional validation rules, more reports, scheduled imports and role-based access as organizational needs grow. The ServiceNow platform provides the base environment for extending the data model and workflow. For larger deployments, data volume, import frequency and access requirements would need to be assessed before production scaling.
